

## Afmitech active in humanitarian aid projects

### **Project**

In case of environmental disasters and in underdeveloped areas it can be essential to establish a well-functioning and stable aid system. Wastewater treatment is an essential part in the setup that aims to improve health conditions. Afmitech has decided to cooperate with Hospitainer, an organization that provides and places mobile hospitals to any place in need of medical aid, and Water for Everyone, a foundation that produces and distributes drinking water purifiers for emergency settings.

### **Location**

Many places in the world do not yet have clean drinking water, especially those places that cope with natural disasters. One of the main causes for drinking water pollution is that the drinking water comes into contact with waste or wastewater. This often results in diarrheal disease. By adjusting the drinking water system to the wastewater treatment system, clean drinking water is guaranteed and the general more hygienic situation the hospital will have far less patients with diarrheal disease and can thus focus on their other patients.

### **Technique**

The Bever Combi Compact is a decentralized wastewater treatment system for biodegradable domestic wastewater.
